

# Pairwise Sequence Alignments

BioInf 2025/2026 1<sup>st</sup> Semester

André Lamúrias

[a.lamurias@fct.unl.pt](mailto:a.lamurias@fct.unl.pt)

# Tentative Schedule

- **1<sup>st</sup> test: 23/10/2025 (Thursday) 11:00**
- **2<sup>nd</sup> test: 12/12/2025 (Friday)**
- 1<sup>st</sup> project:
  - Announced: 9/10/2025
  - Submission: 23/10/2025
  - Discussions: 29/10/2025
- 2<sup>nd</sup> project:
  - Announced: 20/11/2025
  - Submission: 4/12/2025
  - Discussions: 10/12/2025

# Summary

- Sequence alignment applications
- How to align sequences manually
- Manhattan tourist problem
- Needleman-Wunch Algorithm

# Recap

- Biological data is sequential (DNA, RNA, proteins)
- Biological processes transform DNA->RNA->proteins
- Computers can process these sequences and simulate the biological processes
- Computers can find patterns in biological sequences

# Genetic Code and Central Dogma

| AAUGCUCGUAUUUAG                            |
|--------------------------------------------|
| AAU-GCU-CGU-AAU-UUA → Asn-Ala-Arg-Asn-Leu  |
| AUG-CUC-GUA-AUU-UAG → Met-Leu-Val-Ile-Stop |
| UGC-UCG-UAA-UUU → Cys-Ser-Stop-Stop        |

- Is this always true?
- In biology, it rarely is

# Non-ribosomal peptides

- Tyrocidine B1 is an antibiotic produced by *Bacillus brevis*
  - Peptide consisting of 10 AAs

|                       |     |     |     |     |     |     |     |     |     |     |
|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Three-letter notation | Val | Lys | Leu | Phe | Pro | Trp | Phe | Asn | Gln | Tyr |
| One-letter notation   | V   | K   | L   | F   | P   | W   | F   | N   | Q   | Y   |

- We can't find the DNA sequence corresponding to this AA sequence in the *Bacillus brevis* genome!
- Non-Ribosomal Peptides (NRPs) are synthesized by NRP synthetase protein and not by ribosomes – does not require RNA
- DNA → RNA → Protein (NRP synthetase) → NRP

# NRPs

- NRP synthetase has 10 modules – each adds a single aminoacid
- Each module (A-domain) has about 500 AAs
- How can we know which positions are responsible for a specific AA in the NRP?
- Only three matching positions??

```

YAFDLGYTCMFPVLLGGGELHIVQKETYTAPDEIAHYIKKEHGITYIKLTPSLFHTIVNTASFAFDANFESLRLIVLGGEKIIPIDVIAFRKMYGHTEFINHYGPTTEATIGA
AFDVSAGDFARALLTGGQLIVCPNEVKMDPASLYAIIKKYDITIFEATPALVIPLMEYIYEQKLDISQLQILIVGSDSCSMEDFKTLVSRFGSTIRIVNSYGVTEACIDS
IAFDASSWEIYAPLLNGGTVVCIDYYTTIDIKALEAVFKQHHIRGAMLPPALLKQCLVSAPTMISSLEILFAAGDRLLSSQDAILARRAVGSGVYNAYGPTENTVLS
  
```

- What can we do?

# NRPs

- What if we shift the second sequence by one position?

```
YAFDLGYTCMFPVLLGGELHIVQKETYTAPDEIAHYIKEHGIITYIKLTPSLFHTIVNTASFAFDANFESLRLIVLGGEKIIPIDVIAFRKMYGHTEFINHYGPTEATIGA
-AFDVSAGDFARALLTGGQLIVCPNEVKMDPASLYAIIKKYDITIFEATPALVIPLMEYIYEQKLDISQLQILIVGSDSCSMEDFKTLVSRFGSTIRIVNSYGVTEACIDS
IAFDASSWEIYAPLLNGGTVVCIDYYTTIDIKALEAVFKQHHIRGAMLPALLKQCLVSAPTMISSLEILFAAGDRLSSQDAILARRAVGSGVYNAYGPTENTVLS
```

- Now we have 11 matches. A few more adjustments

```
YAFDLGYTCMFPVLLGGELHIVQKETYTAPDEIAHYIKEHGIITYIKLTPSLFHTIVNTASFAFDANFESLRLIVLGGEKIIPIDVIAFRKMYGHTE-FINHYGPTEATIGA
-AFDVSAGDFARALLTGGQLIVCPNEVKMDPASLYAIIKKYDITIFEATPALVIPLMEYI-YEQKLDISQLQILIVGSDSCSMEDFKTLVSRFGSTIRIVNSYGVTEACIDS
IAFDASSWEIYAPLLNGGTVVCIDYYTTIDIKALEAVFKQHHIRGAMLPALLKQCLVSA----PTMISSLEILFAAGDRLSSQDAILARRAVGSGV-Y-NAYGPTENTVLS
```

- We can now say which parts are **conserved** (red) and which are specific to each domain

# Cystic Fibrosis

- Genetic disorder – autosomal recessive (i.e. you can be a carrier without symptoms)
- European ancestry: 1/25 chance of being a carrier, affects 1/3,000 newborns
  - One of the most common rare diseases
- No known cure, but responsible gene has been found (CFTR)
  - However not everyone has the same mutation
- We need sequence alignment to identify candidate disease-causing mutations

| Mutation      | Frequency worldwide <sup>[180]</sup> |
|---------------|--------------------------------------|
| $\Delta$ F508 | 66–70% <sup>[20]</sup>               |
| G542X         | 2.4%                                 |
| G551D         | 1.6%                                 |
| N1303K        | 1.3%                                 |
| W1282X        | 1.2%                                 |
| All others    | 27.5%                                |

# Sequence Alignment

- Mutations: subsequences can disappear (deletions) or be added (insertions) to the genome through evolution (a.k.a. indels)
- Comparing similar sequences of different genomes, the positions may not align perfectly – we need to find the best possible alignment

- This is a bad alignment:

ATGCATGC  
TGCAATGCA

This is a good alignment:

A**TGCATGC**–  
–**TGCATGC**A

- How to decide?

# Sequence Alignment

A T - G T T A T A  
A T C G T - C - C

- At each position:
  - 1 - align the symbols of each sequence at that position
  - 2 – add a gap to one of the sequences and align it with the symbol at the other sequence
- We want to maximize the number of matched position (where the symbol is the same) and minimize the number of mismatches (different symbols) and gaps (sometimes called indels)
  - Convention: gap at the top/first seq – insertions; bottom/second seq – deletion
- Longest common subsequence problem
- In summary: Where to put these gaps?

# Visual Alignments – Dot Plots

- Graphical representations of two sequences:
  - one sequence over the rows and the other over the columns.
- Highlight within the matrix regions of the sequences where the similarity is high.

- ▶ dotlet (<https://dotlet.vital-it.ch>) is a web-based application, to create dot plots from two protein sequences.

# Manhattan Tourist Problem

Pairwise Sequence Alignments (1)

# Manhattan Tourist Problem

- Problem: find maximum weight path
  - (e.g. maximize number of attractions we visit)
- How many possible paths on a  $n \times n$  grid?
- Brute force too slow
- Greedy approach might miss the global optima
- We can generalize this as finding the longest path in a directed acyclic graph (DAG)

# Back to Sequence Alignment

- We can model Pairwise Sequence Alignment as a DAG
  - Each node is a partial solution
  - Each edge corresponds to a choice: match, add gap to first seq, add gap to second seq, which leads to different partial solution
  - Each partial solution has a score

# Substitution Matrices and Gap Penalties

- How to score?
- Example (simplified):
  - Each gap, -2
  - Each identity, +1
  - Each difference, -1

|    |    |    |    |    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | T  | A  | T  | A  | G  | C  | A  | T  | T  | A  | G  |
| -  | -  | A  | T  | -  | G  | C  | A  | C  | T  | A  | G  |
| -2 | -2 | +1 | +1 | -2 | +1 | +1 | +1 | -1 | +1 | +1 | +1 |

Total: +1

# Global Alignment

- Needleman-Wunsch Algorithm

- The best alignment to  $A_{i-1}, B_{j-1}$  plus the match  $A_i, B_j$
- Or the best alignment to  $A_i, B_{j-1}$  and align  $B_j$  with gap
- Or the best alignment to  $A_{i-1}, B_j$  and align  $A_i$  with gap

$$S_{i,j} = \max \begin{cases} S_{i-1,j-1} + sm(A_i, B_j) \\ S_{i,j-1} + g \\ S_{i-1,j} + g \end{cases}$$

- Example: AGC | AAAC

- $g = -2$

- $sm(A_i, B_j) = \begin{cases} 1 & \text{if } A_i = B_j \\ -1 & \text{if } A_i \neq B_j \end{cases}$

|   | -  | A  | A  | A  | C  |
|---|----|----|----|----|----|
| - | 0  | -2 | -4 | -6 | -8 |
| A | -2 |    |    |    |    |
| G | -4 |    |    |    |    |
| C | -6 |    |    |    |    |

# Global Alignment

Diagram illustrating the Needleman-Wunsch algorithm's scoring matrix for global alignment of AGC and AAAC. The matrix shows scores for each pair of characters. A green arrow points from the cell (G, A) to (C, A), indicating a match. A red arrow points from the cell (C, A) to (C, C), indicating a match. A blue arrow points from the cell (C, A) to (C, C), indicating a match. The final alignment is AGC | AAAC.

# Needleman-Wunch Implementation

- We need dynamic programming:
  - Solve smallest problems and use solutions for bigger problems
- Money change problem: minimize number of coins to make change (BA5A)
- Manhattan Tourist Problem: maximize sum of edge weights of path (longest path) (BA5B)
- Since the Manhattan Tourist Problem and Sequence Alignment are both DAGs, we can use similar dynamic programming solution (BA5C)
- But we also need the actual path to obtain the alignment!

# Global Alignment

- Needleman-Wunsch Algorithm

- The best alignment to  $A_{i-1}, B_{j-1}$  plus the match  $A_i, B_j$
- Or the best alignment to  $A_i, B_{j-1}$  and align  $B_j$  with gap
- Or the best alignment to  $A_{i-1}, B_j$  and align  $A_i$  with gap

- $$S_{i,j} = \max \begin{cases} S_{i-1,j-1} + sm(A_i, B_j) \\ S_{i,j-1} + g \\ S_{i-1,j} + g \end{cases}$$

- Trace back from last cell:

# Trace back/backtracking

- Trace back from last cell:
  - Need to “memorize” the decisions took every time a new cell of the  $S$  matrix is computed.
  - Store the information of which was the choice (from the three possible ones) that provided the highest score.
    - Encode direction with 3 symbol alphabet
    - build a trace-back matrix  $T$  with the same dimensions as the  $S$  matrix.
- Having the trace-back information available allows to recover the best alignment by traversing the matrix.

# Needleman-Wunsch Algorithm (BA5C)

- Create matrix  $S$  of  $\text{length}(A)+1$  by  $\text{length}(B)+1$
- From  $S_{0,0}$ , fill first column and row with increasing gap penalty
- Fill matrix with max, left to right, top to bottom:
- $$S_{i,j} = \max \begin{cases} S_{i-1,j-1} + sm(A_i, B_j) \\ S_{i,j-1} + g \\ S_{i-1,j} + g \end{cases}$$
- Trace back from last cell:
  - Diagonal: match the two residues in the alignment
  - Left: align top residue with gap
  - Up: align left residue with gap
- Ties can lead to multiple equivalent alignments

# Substitution Matrices (sm)

- Protein sequences: substitution matrices are calculated based on the probabilities of finding a given pair of aligned aminoacids **in a good alignment**, compared to the probability of obtaining such a pairing by chance.
- Databases with good alignments needs to be used
- Probability of occurrence of a given pair of aminoacids is estimated by its relative frequency in the alignments.
- For each pair of aminoacids, the expected probability is estimated as if pairs were obtained by chance.

# Substitution Matrices (sm)

- The score  $s$  for a given aminoacid pair  $a, b$  is given by:

$$s(a, b) = \text{round} \left( 2 \times \log_2 \frac{P(a, b)}{P(a)P(b)} \right)$$

where  $P(a, b)$  is the estimated probability of occurrence of the pair of aminoacids  $(a, b)$  in the database alignments, and  $P(a)$  and  $P(b)$  are the estimated probabilities for the occurrence of aminoacids  $a$  and  $b$ , respectively.

# BLOSUM62

|   | A  | C  | D  | E  | F  | G  | H  | I  | K  | L  | M  | N  | P  | Q  | R  | S  | T  | V  | W  | Y |

# Protein Alignment (BA5E)

- Needleman-Wunsch Algorithm can also be used
- Example: PHSWG | HGWAG
  - $g = -8$
  - $sm(A_i, B_j) = \text{blosum62}(A_i, B_j)$

|     | gap | H   | G   | W   | A   | G   |
|-----|-----|-----|-----|-----|-----|-----|
| gap | 0   | -8  | -16 | -24 | -32 | -40 |
| P   | -8  | -2  | -10 | -18 | -25 | -33 |
| H   | -16 | 0   | -4  | -12 | -20 | -27 |
| S   | -24 | -8  | 0   | -7  | -11 | -19 |
| W   | -32 | -16 | -8  | 11  | 3   | -5  |
| G   | -40 | -24 | -10 | 3   | 11  | 9   |

$S_{i,j}$

|     | gap | H   | G   | W   | A   | G   |
|-----|-----|-----|-----|-----|-----|-----|
| gap | 0   | -8  | -16 | -24 | -32 | -40 |
| P   | -8  | -2  | -10 | -18 | -25 | -33 |
| H   | -16 | 0   | -4  | -12 | -20 | -27 |
| S   | -24 | -8  | 0   | -7  | -11 | -19 |
| W   | -32 | -16 | -8  | 11  | 3   | -5  |
| G   | -40 | -24 | -10 | 3   | 11  | 9   |

$T_{i,j}$

# Protein Alignment

- Needleman-Wunsch Algorithm can also be used
- Example: PHSWG | HGWAG
  - $g = -8$
  - $sm(A_i, B_j) = \text{blosum62}(A_i, B_j)$

|     | gap | H   | G   | W   | A   | G   |
|-----|-----|-----|-----|-----|-----|-----|
| gap | 0   | -8  | -16 | -24 | -32 | -40 |
| P   | -8  | -2  | -10 | -18 | -25 | -33 |
| H   | -16 | 0   | -4  | -12 | -20 | -27 |
| S   | -24 | -8  | 0   | -7  | -11 | -19 |
| W   | -32 | -16 | -8  | 11  | 3   | -5  |
| G   | -40 | -24 | -10 | 3   | 11  | 9   |

$S_{i,j}$

|     | gap | H   | G   | W   | A   | G   |
|-----|-----|-----|-----|-----|-----|-----|
| gap | 0   | -8  | -16 | -24 | -32 | -40 |
| P   | -8  | -2  | -10 | -18 | -25 | -33 |
| H   | -16 | 0   | -4  | -12 | -20 | -27 |
| S   | -24 | -8  | 0   | -7  | -11 | -19 |
| W   | -32 | -16 | -8  | 11  | 3   | -5  |
| G   | -40 | -24 | -10 | 3   | 11  | 9   |

Best alignment:

P H S W - G  
- H G W A G

Score of the best alignment:

$-8 + 8 + 0 + 11 - 8 + 6 = 9$

# Summary

- Pairwise Sequence Alignment
  - We'll see Multiple Sequence Alignments later
- Dynamic programming for aligning sequences
- Needleman-Wunch algorithm
- Scoring alignments
